

TORIENT

1. TORIENT

Rotates text, mtext, attribute definitions, and blocks with attributes for readability.

Rotates text, mtext, and attribute definition objects so that they end up being as close as possible to horizontal or right-read (similar to the behaviour of dimension text). Objects are rotated about their middle point in 180-degree increments. For example, if the text is upside-down, it becomes right-side up after a TORIENT operation. Similarly, left-read text becomes right-read text. The overall object location is not changed. As an option, you can specify a new absolute orientation angle for all selected text objects.

Text before rotation:

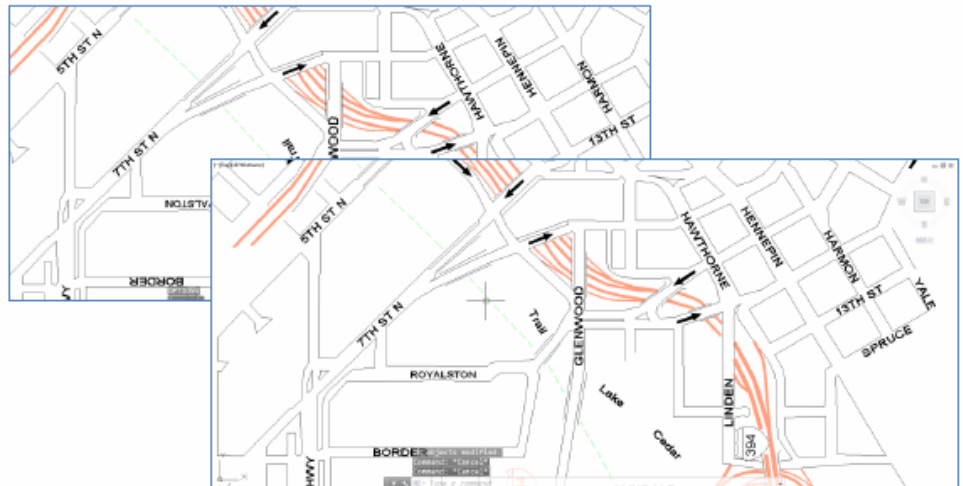

Text after rotation - uses the most readable option:

Text after rotation - uses a specified angle of 0 degrees:

Use the TORIENT command to make un-readable text, more readable.
